

Workforce Intelligence & Ladder ROI Model

Netsirv Ladder turns recruiting, Academy training, certification, advancement, scheduling, compensation, payroll and accounting into one measurable workforce performance system.

Retention

Reduce replacement cost and preserve operating knowledge.

Productivity ramp

Move faster from applicant to qualified productive employee.

Academy

Measure training by operational impact, not completion alone.

Labor utilization

Deploy qualified labor where it creates the best return.

The economic objective is lower total cost to produce each unit of work with a more capable, better deployed workforce.

ROI drivers

The model organizes return into six benefit pools that can be measured against customer baselines.

1

Reduced turnover

Lower separation, recruiting, onboarding and productivity-loss expense.

2

Faster productivity

Shorten the path from hire to certified productive work.

3

Training impact

Connect Academy completion to quality, rework and advancement.

4

Overtime control

Find qualified capacity before overtime is incurred.

5

Administrative scale

Reduce repetitive handoffs across HR, operations and payroll.

6

Internal advancement

Fill more roles from known, trained, advancement-ready employees.

Ladder is strongest when competency, deployment, compensation and financial output are measured from the same record.

Illustrative annual ROI pool

For a 1,000-employee organization, the model shows how benefit categories combine into a planning case.

These are illustrative planning assumptions, not promised results. Implementation replaces them with customer baseline data.

Variables and benchmark assumptions

The first model uses published workforce benchmarks to frame the business case. The final model uses the customer's actual workforce data.

Illustrative variables

Employees	1,000
Baseline turnover	30%
Ladder turnover target	24%
Replacement cost	\$7,500
Annual hires	300
Productive value/day	\$250

Benchmark evidence used

SHRM	Cost-per-hire and replacement-cost planning
Gallup	Engagement linkage to profitability, productivity and turnover
LinkedIn	Internal mobility, learning culture and retention patterns
Brandon Hall	Onboarding and training case-study impact
Customer baseline	Final source of truth

The ROI model is a measurement system: establish baseline, deploy Ladder, measure variance, then tune recruiting, Academy, scheduling and compensation decisions.
